Dougherty Valley HS Chemistry - AP Gas Laws – Boyle's Law

Name:

Period:

Boyle's Law states that the volume of a gas varies inversely with its pressure if temperature is held constant. (If one goes up, the other goes down.) We use the formula:

$$P_1 x V_1 = P_2 x V_2$$

Directions: Solve the following problems (assuming constant temperature). Assume all number are 3 significant figures. Remember to show your work!

1)	A sample of oxygen gas occupies a volume of 250. mL at 740. torr pressure. What volume will it occupy at 800. torr pressure? <u>231 mL</u>
2)	A sample of carbon dioxide occupies a volume of 3.50 Liters at 125 kPa pressure. What pressure would the gas exert if the volume was decreased to 2.00 liters? <u>219 kPa</u>
2)	A 2.00 Liter container of nitrogen had a pressure of 2.20 atm. What you would be persent to
3)	decrease the pressure to 1.00 atm? <u>6.40 L</u>
4)	Ammonia gas occupies a volume of 450.0 mL as a pressure of 720. mmHg. What volume will it occupy at standard pressure (760 mmHg)? <u>426 mL</u>
5)	A 175 mL sample of neon had its pressure changed from 75.0 kPa to 150.0 kPa.
	What is its new volume? <u>87.5 mL</u>
