N35 - SOLUTIONS

Colligative Properties

N35 - SOLUTIONS Colligative Properties

Target: I can take into account how the number of particles in a solution affects various properties.

Ionic Solutes

Colligative properties

Properties whose value depends only on the number of solute particles, and not on what they are.

-Value of the property depends on the concentration of the solution.

The difference between the solution and the pure substance is related to the different attractive forces present in the solution, and the solute particles occupying solvent molecules positions.

Colligative Properties

Colligative properties are those that depend on the concentration of particles in a solution, not upon the identity of those properties.

- Boiling Point Elevation
- Freezing Point Depression
- Vapor Pressure Lowering
- Osmotic Pressure

The van't Hoff Factor, i

Electrolytes may have two, three or more times the effect on boiling point, freezing point, and osmotic pressure, depending on its dissociation.

Ionic Comp.	$AB \rightarrow A^+ + B^-$		$AB \rightarrow A^+ + B^-$		$C_2D \rightarrow$	2C ⁻ + D ²⁻
#particles	1	2	1	3		

Nonelectrolyte $XY(s) \rightarrow XY(aq)$ #particles1

Dissociation Equations and *i*

$$i = 2$$
NaCl(s) \rightarrow Na⁺(aq) + Cl⁻(aq) $i = 2$
AgNO₃(s) \rightarrow Ag⁺(aq) + NO₃⁻(aq) $i = 3$
MgCl₂(s) \rightarrow Mg²⁺(aq) + 2 Cl⁻(aq) $i = 3$
Na₂SO₄(s) \rightarrow 2 Na⁺(aq) + SO₄²⁻(aq)
AlCl₃(s) \rightarrow Al³⁺(aq) + 3 Cl⁻(aq) $i = 4$

Ideal vs. Real van't Hoff Factor

The ideal van't Hoff Factor is only achieved in <u>VERY DILUTE</u> solution.

	Molality, <i>m</i>					
Solute	1.0	0.10	0.010	0.0010		Inf dil [*]
NaCl	1.81	1.87	1.94	1.97		2
MgSO ₄	1.09	1.21	1.53	1.82		2
$Pb(NO_3)_2$	1.31	2.13	2.63	2.89		3

Boiling Point Elevation

Each mole of solute particles raises the boiling point of 1 kilogram of water by 0.51 degrees Celsius.

$$\Delta T = i \cdot K_b \cdot m_{solute}$$

K_b= kilogram/mol (for water 0.51 °C)
m = molality of the solution
i = van't Hoff factor

Freezing Point Depression

Each mole of solute particles lowers the freezing point of 1 kilogram of water by 1.86 degrees Celsius.

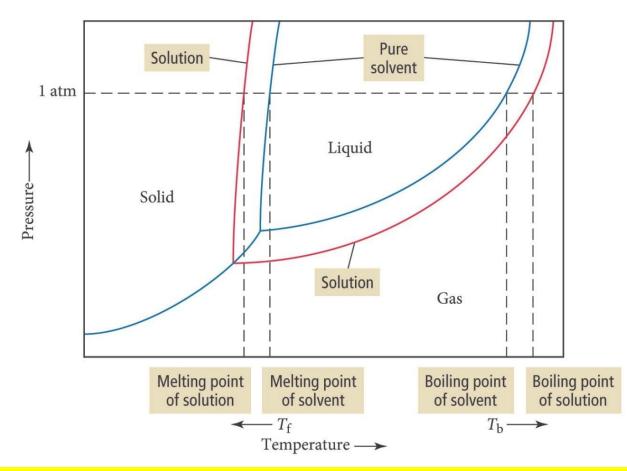

$$\Delta T = i \cdot K_f \cdot m_{solute}$$

K_f = kilogram/mol (for water 1.86 °C)
m = molality of the solution
i = van't Hoff factor

Freezing Point Depression and Boiling Point Elevation Constants, °C/m

Solvent	K _f	K _b	
Acetic acid	3.90	3.07	
Benzene	5.12	2.53	
Nitrobenzene	8.1	5.24	
Phenol	7.27	3.56	
Water	1.86	0.512	

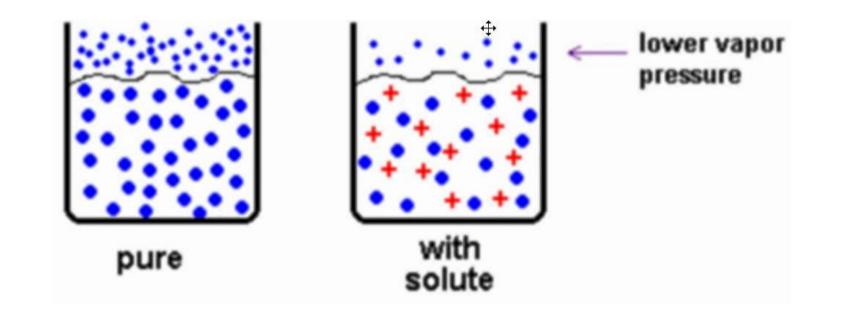

Freezing Point Depression and Boiling Point Elevation

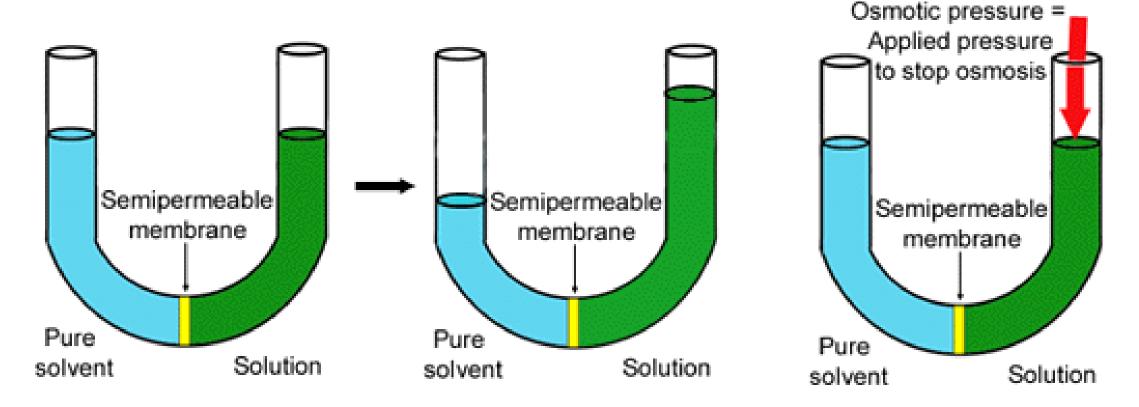

Vapor Pressure Lowering

$P_1 = X_1 P_1^0$

Osmotic Pressure

The minimum pressure that stops the osmosis is equal to the osmotic pressure of the solution

Osmotic Pressure Calculations

$\Pi = iMRT$

- **I** = Osmotic pressure
- **M** = Molarity of the solution
- **R** = Gas Constant = 0.08206 L·atm/mol·K
- **T** = Absolute Temperature (K)

Suspensions and Colloids

Suspensions and colloids are NOT solutions.

Suspensions - The particles are so large that they settle out of the solvent if not constantly stirred.

Colloids - The particles intermediate in size between those of a suspension and those of a solution.

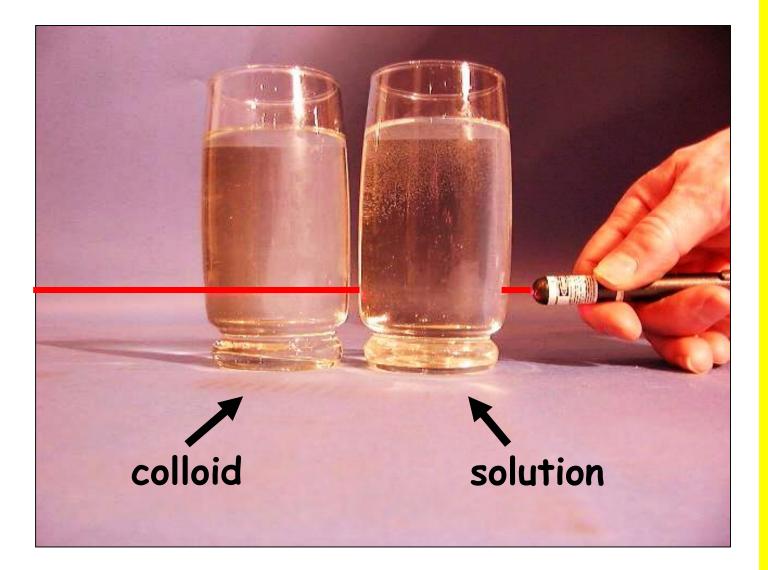

Types of Colloids

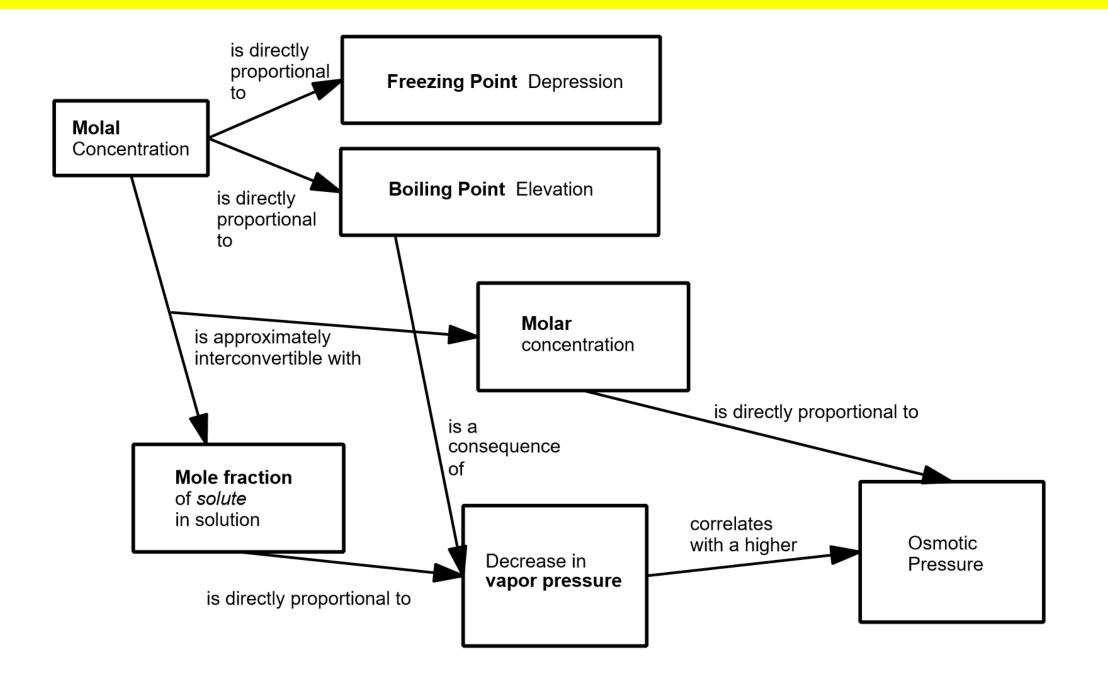

Examples	Dispersing Medium	Dispersed Substance	Colloid Type
Fog, aerosol sprays	Gas	Liquid	Aerosol
Smoke, airborn germs	Gas	Solid	Aerosol
Whipped cream, soap suds	Liquid	Gas	Foam
Milk, mayonnaise	Liquid	Liquid	Emulsion
Paint, clays, gelatin	Liquid	Solid	Sol
Marshmallow, Styrofoam	Solid	Gas	Solid Foam
Butter, cheese	Solid	Liquid	Solid Emulsion
Ruby glass	Solid	Solid	Solid sol

The Tyndall Effect

Colloids scatter light, making a beam visible. Solutions do not scatter light.

Which glass contains a colloid?

All of the following are colligative properties except:

Osmotic Pressure

Boiling Point elevation

Freezing Point depression

Density elevation

None of these

All of the following are colligative properties except:

Osmotic Pressure

Boiling Point elevation

Freezing Point depression

Density elevation

121.2 g of NaCl completely dissolve (producing Na⁺ and Cl⁻ ions) in 1.00 Kg of water at 25°C. The VP of pure water at this temp is 23.8 torr. Determine the VP of the solution

22.1 torr 22.9 torr B 20.6 torr 19.9 torr D 23.8 torr

121.2 g of NaCl completely dissolve (producing Na⁺ and Cl⁻ ions) in 1.00 Kg of water at 25°C. The VP of pure water at this temp is 23.8 torr. Determine the VP of the solution

A 22.1 torr	121.2g	1mol	2mol ions	=
B 22.9 torr		58.44g	1mol NaCl	4.15 mol
C 20.6 torr	1000g	1mol	= 55.5m	nol
D 19.9 torr	55	18.02g	P =	=
E 23.8 torr X _H	₂₀ = 55 (4.15	. 5 = (+ 55.5)	0.930 (0. = 2	930)(23.8) 22.1torr

At 40°C, heptane has a vapor pressure of about 92.0 torr and octane has a vapor pressure of about 31.2 torr. Assuming ideal behavior, what is the vapor pressure of a solution that contains twice as many moles of heptane as octane?

61.3 torr

51.5 torr

71.7 torr

82.1 torr

None of these

B

At 40°C, heptane has a vapor pressure of about 92.0 torr and octane has a vapor pressure of about 31.2 torr. Assuming ideal behavior, what is the vapor pressure of a solution that contains twice as many moles of heptane as octane?

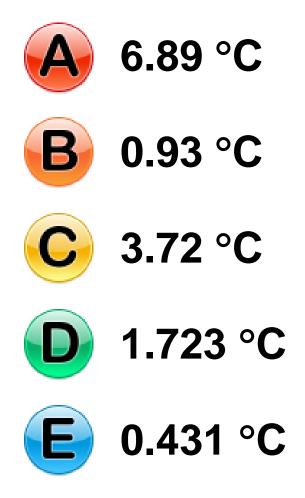

Octane = 1 mol Heptane = 2 mol

 $\mathbf{P} = \mathbf{X}_1 \mathbf{P}_1 + \mathbf{X}_2 \mathbf{P}_2$

$$\mathsf{P} = \left(\frac{1}{3}\right)(31.2) + \left(\frac{2}{3}\right)(92.0)$$

P = 71.7 torr

What is the boiling point change for a solution containing 0.681 moles of naphthalene (a nonvolatile, nonionizing compound) in 250. g of liquid benzene? ($K_b = 2.53 \text{ °C/m}$ for benzene)

What is the boiling point change for a solution containing 0.681 moles of naphthalene (a nonvolatile, nonionizing compound) in 250. g of liquid benzene? ($K_b = 2.53 \text{ °C/m}$ for benzene)

A 6.89 °C $\Lambda T = iKm$ **B** 0.93 °C m = mol_{solute}/kg_{solvent} $=\frac{0.681 \, mol}{0.250 \, kg} = 2.724 \, \mathrm{m}$ **C** 3.72 °C **D** 1.723 °C $\Delta T = (1)(2.53)(2.724) = 6.89^{\circ}C$ 0.431 °C

A 7.12 g sample of a compound is dissolved in 250. grams of benzene. The freezing point of this solution is 1.02° C below that of pure benzene. What is the molar mass of this compound? (K_{f benzene} = 5.12 °C/m). Ignore sig. figs.

35.7 g/mol

143 g/mol

286 g/mol

5.67 g/mol

71.5 g/mol

B

A 7.12 g sample of a compound is dissolved in 250. grams of benzene. The freezing point of this solution is 1.02°C below that of pure benzene. What is the molar mass of this compound? $(K_{f benzene} = 5.12 \text{ °C/m})$. Ignore sig. figs.

A 35.7 g/mol	$\Delta T = iKm$	1.02 = (1)(5.12)(m)
B 143 g/m	O m = 0.1	99 mol _{solute} /kg _{solvent}
C 286 g/mol		$\frac{mol}{50 \ kg} = 0.04975 \ moles$
D 5.67 g/mol	mm = g/mol	= 7.12g/0.04975mol
E 71.5 g/mol		= 143g/mol

Determine the Osmotic Pressure of a solution that contains 0.017 g of a hydrocarbon solute (molar mass = 340 g/mol) dissolved in benzene to make 350-ml solution. The temperature is 20.0°C

0.18 torr **0.9 torr** B 1.2 torr 2.6 torr 2.4 torr

Determine the Osmotic Pressure of a solution that contains 0.017 g of a hydrocarbon solute (molar mass = 340 g/mol) dissolved in benzene to make 350-ml solution. The temperature is 20.0°C

0.18 torr	Π =i			
	0.017g	1mol	= 5x10 ⁻⁵ mol	
B 0.9 torr		340g		
C 1.2 torr	- (5x10⁻⁵mol)/(0.350L) = 1.43x10⁻⁴ M			
D 2.6 torr	Π=((1)(1.43x 1	0 ⁻⁴)(62.4)(293)	
E 2.4 torr			= 2.6 torr

Can stop here! Henry's Law not covered anymore. You can keep going if interested though!

Henry's Law (removed from AP)

- The solubility of a gas (S_{gas}) is directly proportional to its partial pressure, (P_{gas}) . $S_{gas} = k_{H}P_{gas}$
- *k*_H is called the Henry's law constant.

TABLE 12.4 Henry's LawConstants for Several Gases inWater at 25 °C

Gas	k _H (M∕atm)
02	$1.3 imes10^{-3}$
N_2	$6.1 imes10^{-4}$
CO ₂	$3.4 imes10^{-2}$
NH ₃	$5.8 imes10^{1}$
Не	$3.7 imes 10^4$

A correct statement of Henry's law is:

the concentration of a gas in solution is inversely proportional to temperature.

the concentration of a gas in solution is directly proportional to the mole fraction of solvent.

the concentration of a gas in solution is independent of pressure.

the concentration of a gas in a solution is inversely proportional to pressure.

none of these

A correct statement of Henry's law is:

the concentration of a gas in solution is inversely proportional to temperature.

the concentration of a gas in solution is directly proportional to the mole fraction of solvent.

the concentration of a gas in solution is independent of pressure.

the concentration of a gas in a solution is inversely proportional to pressure.

none of these

The solubility of O_2 in water is 0.590g/L at an oxygen pressure of around 14.7 atm. What is the Henry's Law constant for O_2 (in units of mol/L-atm)?

4.01E⁻² **B** 1.25E⁻³ **C** 7.97E² 2.71E⁻¹

None of them are within 5% of the correct answer

The solubility of O_2 in water is 0.590g/L at an oxygen pressure of around 14.7 atm. What is the Henry's Law constant for O_2 (in units of mol/L-atm)?

4.01E ⁻²	S = kP			
B 1.25E ⁻³	0.590g 1mol		=0.0184	
C 7.97E ²		32g	mol	
	(0.0184 mol/L) = K (14.7atm)			
2.71E ⁻¹	K = 1.25E-3			
F None of them ar	o within 5%	of the co	orract answa	

None of them are within 5% of the correct answer
