

# Enthalpy of Rx Feedback Rubric

Sections	Descriptions	Self-Assessment
<b>Title</b>	<ul style="list-style-type: none"> <li>• Descriptive</li> <li>• Include the reaction(s) as formula or words</li> <li>• Does not include the words “quantitative” or “qualitative”</li> </ul>	
<b>Data Table</b>	<ul style="list-style-type: none"> <li>• All quantitative data presented at numbers</li> <li>• Units must be included with number or stated in row</li> </ul>	
<b>Discussion Questions</b>	<ul style="list-style-type: none"> <li>• All answered</li> <li>• All questions rephrased as part of the question</li> <li>• Significant detail to support the answers</li> </ul>	
<b>Calculations</b>	<ul style="list-style-type: none"> <li>• Calculation for Temperature Change</li> <li>• Calculation for heat, <math>q</math>, for EACH reaction</li> <li>• Calculation for <math>\Delta H</math> for EACH reaction</li> <li>• Calculation of percent error (Accepted vs. Experimental)</li> </ul>	

**Discussion Questions** – The highlighted ones were graded.

- All were graded for completion, detail, thought AND accuracy
- All were graded for completion, detail, and thought

## ANSWERS TO THE DATA ANALYSIS QUESTIONS

1. Answers will vary. For the sample data, the heat energy for each reaction is shown below.

$$\text{Reaction 1: } q = (4.18 \text{ J/g}\cdot^{\circ}\text{C} \times 103 \text{ g} \times 12.71^{\circ}\text{C}) = 5472 \text{ J} = 5.47 \text{ kJ}$$

$$\text{Reaction 2: } q = (4.18 \text{ J/g}\cdot^{\circ}\text{C} \times 103 \text{ g} \times 1.01^{\circ}\text{C}) = 434.8 \text{ J} = 0.435 \text{ kJ}$$

$$\text{Reaction 3: } q = (4.18 \text{ J/g}\cdot^{\circ}\text{C} \times 103 \text{ g} \times 11.27^{\circ}\text{C}) = 4852 \text{ J} = 4.85 \text{ kJ}$$

2. Answers will vary. Because 50 mL of 2 M solutions were used in all reactions, the conversion of  $q$  to kJ/mol of reactant is perfunctory, as shown below.

$$\text{Reaction 1: } 5.47 \text{ kJ} \div 0.10 \text{ mol} = -54.7 \text{ kJ/mol}$$

$$\text{Reaction 2: } 0.435 \text{ kJ} \div 0.10 \text{ mol} = -4.35 \text{ kJ/mol}$$

$$\text{Reaction 3: } 4.85 \text{ kJ} \div 0.10 \text{ mol} = -48.5 \text{ kJ/mol}$$

3. The experimental molar enthalpy of Reaction 3, using the data from Question 2, is  $-50.35 \text{ kJ}$ . Hess's law is used by determining the sum of Reaction 1 plus the reverse of Reaction 2. For the sample data, the application of Hess's law yields:

$$-54.7 \text{ kJ/mol} + 4.35 \text{ kJ/mol} = -50.35 \text{ kJ/mol}$$

4. The accepted (text value) of the molar enthalpy of Reaction 3 is  $-52.2 \text{ kJ/mol}$ . Applying Hess's law yields:  $-55.9 \text{ kJ/mol} + (3.70 \text{ kJ/mol}) = -52.2 \text{ kJ/mol}$ . The experimental value and the accepted value of  $\Delta H$  compare well for the sample data.

5. The sample data and the experimental values of  $\Delta H$  for Reaction 3, derived from summing the values of  $\Delta H$  for Reactions 1 and 2, support Hess's law. Your students will have three values of  $\Delta H$  for Reaction 3, and it may be helpful to guide them through the source of each of the three values.

## SAMPLE DATA

	Reaction 1	Reaction 2	Reaction 3
Maximum temperature (°C)	34.16°C	21.84°C	32.01°C
Initial temperature (°C)	21.45°C	20.81°C	20.74°C
Temperature change ( $\Delta T$ )	12.71°C	1.01°C	11.27°C
